

THE PROBLEM

Apple PCC, NVIDIA Confidential Compute, Intel TDX, and AMD SEV-SNP all attest AI inference, but each requires a vendor PKI rooted in a dedicated secure element (Secure Enclave, DICE, TPM EK). They authenticate the SKU class, not the individual die: two H100s look identical. And if you do not trust the vendor's key chain, you have no attestation at all.

OUR 3-STEP SOLUTION

TWIN DROIDSTwo physically identical Strix Halo APUs. Same SKU. Same firmware. Different fingerprints.

FABRICCRYPT vs VENDOR-ROOTED ATTESTATION

Scheme	Vendor PKI	Dedicated chip	Per-die	Commodity HW
Apple PCC	Required	Secure Enclave	No (SKU)	Apple only
NVIDIA CC	Required	DICE / VCEK	No (SKU)	H100 / B100
Intel TDX	Required	TDX module	No (SKU)	Intel only
AMD SEV-SNP	Required	PSP	No (SKU)	EPYC only
TPM 2.0	EK cert	Discrete TPM	Per chip	Limited
FabricCrypt	None	None	YES	Any AMD APU

Honest scope: primitive at n=2 chassis (ikaros + daedalus). Empirical attack-cost; no formal cryptographic reduction. Exploratory stylometric divergence (sec 7.6)
